

Requirements

- 4GB of RAM
- Linux (it will not work under Windows/WSL)
- Root access (bbb-docker uses host networking, so it won't work with Kubernetes, any "CaaS"-Service, etc.)
- Public IPv4 (expect issues with a firewall / NAT)
- firewall allows internal networking (e.g. for ufw: ufw allow 10.7.7.0/24)
- git installed

Install production server

1. Ensure the requirements above are fulfilled (it really doesn't work without them)
2. Install docker-ce & docker-compose-plugin
 - i. Ensure docker works with `$ docker run hello-world`
 - ii. Ensure you use a docker version ≥ 23.0 : `$ docker --version`
3. Clone this repository
4. `$ git clone https://github.com/bigbluebutton/docker.git bbb-docker`
5. `$ cd bbb-docker`
6. `$ git checkout main`
7. # optional: use the more stable main branch (often much older)
8. Run setup:

`$ ./scripts/setup`

9. (optional) Make additional configuration adjustments
10. `$ nano .env`
11. # always recreate the docker-compose.yml file after making any changes

`$ ./scripts/generate-compose`

12. Start containers:

`$ docker compose up -d --no-build`

13. If you use greenlight, you can create an admin account with:

`$ docker compose exec greenlight bundle exec rake admin:create`

Development setup

1. Clone this repository

`$ git clone --recurse-submodules https://github.com/bigbluebutton/docker.git bbb-dev`

2. Start dev server

3. `$ cd bbb-dev`

`$ ./scripts/dev`

4. Use API Mate with the link presented in the console to create & join a conference
