

Install Turn Server for TALK

"High-performance backend not configured"
and enabling reliable audio/video calls,

then the easiest setup is:

Step 1 — Install Nextcloud Talk

Check if it's already installed:

```
sudo -u www-data php /var/www/nextcloud/occ app:list | grep spread
```

If nothing appears:

```
sudo -u www-data php /var/www/nextcloud/occ app:install spread
```

```
sudo -u www-data php /var/www/nextcloud/occ app:enable spread
```

Talk is provided by the app called **Nextcloud Talk**.

Step 2 — Install Coturn

On Ubuntu:

```
sudo apt update
```

```
sudo apt install coturn
```

Verify:

```
turnserver --version
```

Step 3 — Generate TURN Secret

```
openssl rand -hex 32
```

Example output:

```
9c7b8c5d4e1f.....
```

Save it.

Step 4 — Configure Coturn

Edit:

```
sudo nano /etc/turnserver.conf
```

Add:

```
listening-port=3478
```

```
fingerprint
```

```
use-auth-secret
```

```
static-auth-secret=YOUR_SECRET
```

```
realm=kitcld.kayson-ir.com
```

```
total-quota=0
```

```
bps-capacity=0
```

```
stale-nonce
```

```
no-multicast-peers
```

Recommended by the Nextcloud Talk TURN documentation.

Step 5 — Enable Coturn Service

```
sudo systemctl enable coturn
```

```
sudo systemctl restart coturn
```

```
sudo systemctl status coturn
```

Step 6 — Open Firewall Ports

If UFW is enabled:

```
sudo ufw allow 3478/tcp
```

```
sudo ufw allow 3478/udp
```

If your VPS provider has a cloud firewall, open the same ports there as well. Missing firewall rules are a common cause of Talk connectivity issues.

Step 7 — Configure TURN in Nextcloud

Go to:

Administration Settings

→ Talk

→ STUN/TURN Servers

Add:

TURN Server

kitcld.kayson-ir.com:3478

Secret

YOUR_SECRET

Protocols

UDP + TCP

STUN Server

kitcld.kayson-ir.com:3478

Do not include https:// or turn://; use only host:port.

Step 8 — Test

Create a Talk conversation and join from:

- Browser A
- Browser B
- Different network (mobile hotspot preferred)

If audio/video connects, TURN is working.

Important

For **2–3 users**, TURN alone is usually enough.

For **larger meetings (5, 10, 20+ participants)**, you need the **High Performance Backend (HPB)** in addition to TURN. The HPB uses a signaling server and media forwarding server and is what removes the warning you're seeing.

Since your server already has **16 GB RAM and 6 CPU cores**, it can run a small HPB deployment. If you want, I can give you the complete **Ubuntu + Apache + Nextcloud Talk HPB installation guide** (Docker-based, about 15–20 minutes setup).
